

## **Amendments to the Specification**

Please amend the paragraph beginning on page 18, line 10 as follows:

The WAN keeper monitors the default (cheaper) link for bandwidth utilization. Upon utilization being less~~more~~ than its threshold limit (the maximum threshold), the WAN keeper will take measures so that future outgoing voice calls will be directed to the expensive link. WAN keeper will periodically check back on the cheaper or default link to determine if the traffic has fallen below the threshold. If so, it will take measures to direct VoIP calls back to the default link.
